

Capacity and cost (CPU, no GPU)

Worked example (evaluation host, not a vendor quote)

Measured ~6.2 ms/frame against a 10 ms hop (realtime x ~1.6).

At 70% utilization that is ~1.1 concurrent full-rate calls per core.

1 000 concurrent calls => ~900 cores + 10% spare.

At USD 0.04 per vCPU-hour this is an illustrative ~29k USD / month of CPU, before ASR. VAD skip and fuse-every-n cut that; a GPU encoder would raise it.
